ABSTRACT A 31-year-old male received oral imatinib mesylate 400 mg once daily for chronic granulocytic leukemia. The patient had no previous history of heart disease or hypertension. An ECG and ultrasound revealed normal cardiac function before treatment. On day 1 of therapy, he experienced precordial discomfort. On day 6, he developed arrhythmia and atrioventricular block III, his heart rate was 45 beats/min. Imatinib mesylate was discontinued. He received supportive treatment and a temporary pacemaker. His symptoms improved.

KEY WORDS imatinib mesylate; atrioventricular block; adverse reactions
过敏性皮炎患者静脉滴注复方甘草酸苷出现过敏性休克及室性早搏
